

ABSTRACT OF THE DISCLOSURE

A communication terminal is provided with a line establishing means which establishes lines to a plurality of different terminals on the other side in parallel with each other. Moreover, the communication terminal is provided with a microphone through which voice is inputted, and a communication control means for transmitting voice inputted through the microphone to a plurality of different terminals on the other side. Thus, it is possible to simultaneously transmit the voice to a plurality of partners. Furthermore, the communication control means can receive voices transmitted from a plurality of difference terminals on the other side, and since the voices received by the communication control means are outputted from a speaker, it is possible to carry out conversations among a plurality of users at the same time.
